

## The Objective Necessity of Ensuring the Economic Security of Enterprises

Aminov Zarif Yusupovich

Teacher of Samarkand Institute of Economics and Service, Candidate of Economic Sciences

### Abstract

*Security is a very broad concept. Because its scope covers security such as political, economic, environmental, military. This is a very complex process, as it is clear that sustainable development of a society cannot be achieved without any of the security concepts cited. This article discusses security and related terms.*

**Keywords:** *security, economic security, loss, profit, information, object, business entities, government, competition, firms.*

---

It should be noted that in the context of market relations, the security services of enterprises in the field of services are also important. Until recently, security services were handled only by government agencies. Now, along with them, non-governmental organizations dealing with security have begun to emerge. The security service of enterprises is aimed at ensuring their economic security. Currently, enterprises and institutions are concluding security agreements with private NGOs. At the same time, in accordance with the contract, non-governmental companies engaged in the protection of facilities undertake all the losses lost and stolen from the organization, as well as stabilize the financial condition of the enterprise, define development strategies and protect the enterprise from unfair competition. Such a situation provides mutual responsibility and interest.

The issue of creating material goods is only one of the issues that need to be addressed in order to improve the living standards of the people, and its storage and delivery to consumers without destroying the nest is one of its most important aspects. Achieving this is also an important factor in mitigating the impact on the economy as a result of the ongoing global financial and economic crisis and the emergence of dangerous infectious diseases. Therefore, the issue of economic security of enterprises should be given special attention. After all, saving on standard losses is also equivalent to additional production. Therefore, the issue of economic security of enterprises should be an integral and most important part of their activities.

Ensuring the economic security of enterprises is also a special type of service. This type of service, like other services, has its own economic concepts and indicators such as size, quality, quantity, price. Therefore, it is necessary to rely on the indicators that represent them in the study and evaluation. One of the most important indicators of this service is its efficiency and quality.

Indicators of the quality of economic security services of enterprises are determined by the absence of any losses and thefts at the facility during the reporting period. As a second indicator, it is advisable to measure the level of timely recovery of lost or stolen material goods in the enterprise by the security company.

In the current pandemic situation, economic development is very difficult<sup>1</sup>.

Pricewaterhouse Coopers and Oxford University forecast that by 2030, robots will occupy 30% of jobs. This means that the already high unemployment rate will rise further<sup>2</sup>.

If the economic security of enterprises is ensured, various losses are prevented, our created material goods will reach consumers in a timely and quality manner, and thus our measures to improve the welfare of the population will be implemented in practice.

It is obvious that the security of enterprises, including those engaged in the provision of services and services, as an integral part of the economy, is one of the most pressing issues today.

With the deepening of market relations in our country, the issue of economic security of the enterprise, including service enterprises, and its provision becomes an objective necessity. There is a certain degree of trade secret to this. Because when the property is private, the entity uses its own funds to meet the economic process, its need for funds, and to cover the losses. If an entrepreneur loses his funds and loses ownership, it means that his activity will stop. As a result, many people become unemployed and their marital status deteriorates. This situation will ultimately build candidates for the increase in low-income poverty in society. As a result, the development of a private property-based enterprise is not only economically important but also socially important. After all, this process is directly related to the well-being of the population.

In the conditions of market relations, there is an objective need to constantly ensure the economic security of the enterprise, including service enterprises. This objective necessity requires great attention from his leadership, organizational work, and wise management. As a result, any manager must have a good knowledge of the mechanisms of economic management, as well as the knowledge of good management of the enterprise. In this regard, we think it is appropriate to pay special attention to ensuring the economic security of the enterprise, including service enterprises. This is because in a market economy dominated by free competition, each business entity must increase its responsibility to ensure its economic security and strive to ensure not only their survival but also their sustainable development. This is a very complex and multifaceted process in the system of economic affairs.

The issue of economic security of enterprises, including service enterprises, has a special place in the security system. Because this is not only an economic issue, but also an important social one. This cannot be achieved by performing one or more activities at a given time. This goal can be achieved by applying a set of measures that are usually well thought out, routine, and consistent. As a result, a number of measures will need to be taken to ensure the economic security of the enterprise.
